

# Data Science.

*For economists*

Richard Davies  
Autumn 2022

# Week 2.

- **Charts.** The good the bad and the ugly.
- **What makes a great chart?** And what to avoid.
- **Two ways to make a live chart.** APIs vs GitHub data.
- **Practical 2.** Taking a bad chart and making it good.

# Reminder I: A vital diary date.

## *The festival of economics*

- Part of your portfolio will be to comment on / analyse and argument made at the Festival of Economics.
- The dates for this are 15<sup>th</sup> -16<sup>th</sup> -17<sup>th</sup> November.
- The events are here: <https://www.economicsobservatory.com/events>
- You will need to attend at least one session. The cost is £5.\*
- The event is an opportunity to meet professional economists and potential employers, and we look forward to seeing you there.

*\* If this is problem for anyone, please let us know, as the Observatory will have some sponsored tickets we may be able to provide free of charge.*

# Reminder II: chart ideas and code.

*Sign up to the Observatory Newsletter and social feeds*

**Data stories.** Last week we wrote about the sterling crash, and made 10 charts.

<https://www.economicsobservatory.com/whats-happening-in-uk-markets-the-story-in-ten-charts>

**Economics Observatory.** Sign up for our newsletter. We will be emphasising charts and data over coming months.

<https://www.economicsobservatory.com/join-us>

**Social Accounts.** Follow our social accounts. On IG: [@RapidCharts](#), [@EconomicsObservatory](#). On Twitter: [@EconObservatory](#), [@RD\\_Economist](#). We will post chart ideas, along with code, during the duration of the course.

These will help with both your portfolio and project.

Bad, Ugly ... and Good.

# Dataviz heroes.

*Playfair, Nightingale and other pioneers*

# William Playfair.

- Born in 1759, William Playfair invented the chart.
- *The Commercial and Political Atlas* (1785) which featured 40 charts covering trade, debt, expenditure and other economic matters
- Playfair was the first to add the vertical axis (previous charts did not have this feature, meaning the way data were stacked vertically meant nothing).
- His charts were relevant to policy. Playfair made charts that demand those in charge of policy to pay attention

*“Information, that is imperfectly acquired, is generally as imperfectly retained; and a man who has carefully investigated a printed table, finds, when done, that he has only a very faint and partial idea of what he has read; and that like a figure imprinted on sand, is soon totally erased and defaced.”*

# Politics and trade.

# Real wages.

# Florence Nightingale.

- Born in 1820, she was a disruptor of both medicine and data
- Statistician, campaigner, nurse, and inventor, she is best known as the founder of modern nursing: the lady with the lamp
- After working on the frontline during the Crimean war, she decided to communicate the miserable conditions she witnessed, creating pioneering using data visualisations to make her case

# John Snow.

- John Snow was an English physician
- Studied 1854 cholera epidemic in London
- Founding father of epidemiology, a branch of medicine that studies the contraction, spreading and control of disease.
- Data pioneer, using carefully plotted maps to solve a problem that had defeated scientists of his day
- Story of the Broad Street pump

# Edward Tufte.

- The American statistician and graphic design theorist.
- *The Visual Display of Quantitative Information*, April 1983
- Primary message: designers didn't have to sacrifice mathematical accuracy in the quest for elegance
- “**data-ink ratio**” to measure the proportion of a given graphic which was simply illustration rather than a representation of data.
- He questioned the “data density” of graphics. And for those graphics which his disliked most coined a new word: “chartjunk”.

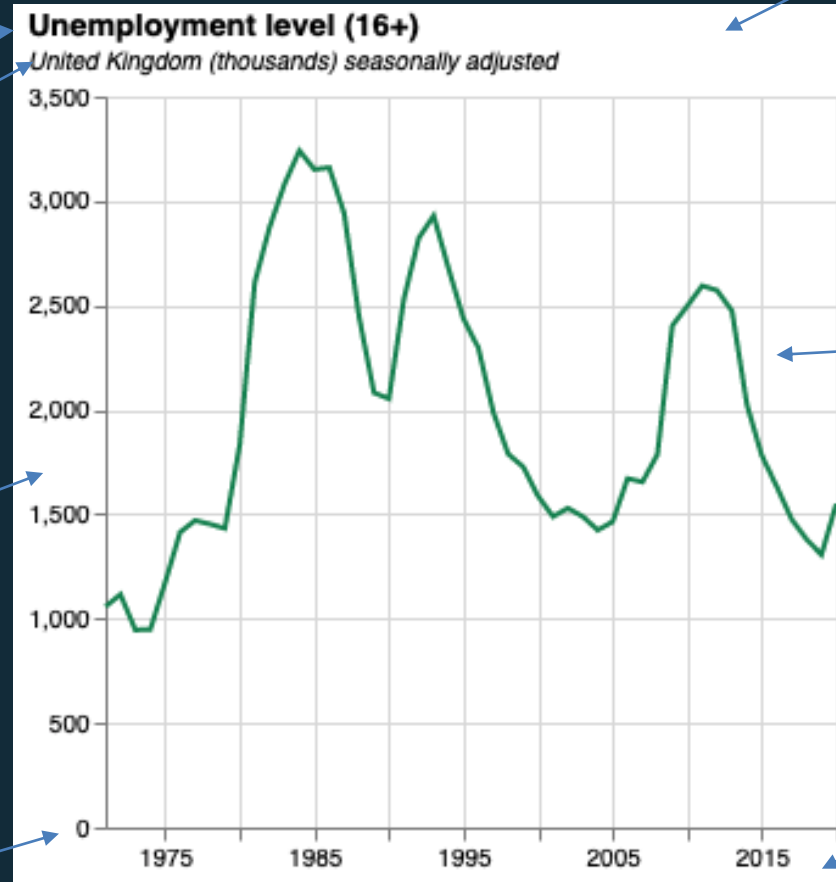

# Anatomy of a good chart.

Y axis metric included in the title

Subtitle including extra detail (such as units)

Y axis label not needed because of title

Quantitative data should start from zero by default

Size. The original version of this chart is 300px by 300px. This is perfect for mobile.

Eye-catching colour. Make sure colours are consistent across your work

X axis label not needed because, in most cases, time is obvious

# A useful checklist

## *Play your Charts Right*

A useful simple set of rules to follow

Available in the course folder: [here](#)

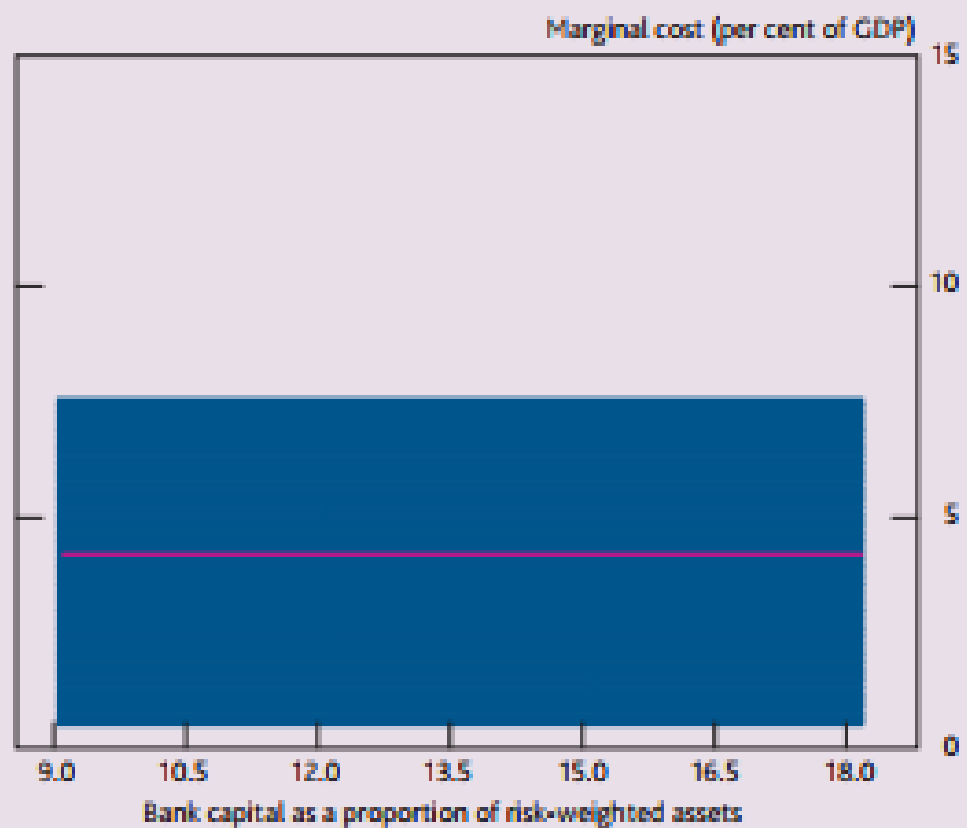

# Killer charts vs Chartjunk.

*Some examples to discuss*

Not everything should be a chart.

Chart A Marginal cost from higher capital levels

# Data workflow.

*Two approaches to sourcing and embedding data*

# Option 1. Direct link to API

## Pros

- Auto-updating
- No data errors

## Cons

- Slow/lags
- Multiple downloads: may be costly if a paid API.
- If API is unstable, your analysis becomes unstable.

# Option 2. Link to live CSV file

## Pros

- Fast
- Stable
- APIs don't always exist: may be your only option.

## Cons

- Won't auto-update
- Requires maintenance

# Practical 2.

Embedding charts:

1. FT example: a problematic chart.
  1. Data cleaning.
    1. String functions
    2. Date-time functions
2. Embedding your chart.
3. Discussion: how to improve the chart.
4. API driven charts using ONS API.

# Homework 2.

*Week 2 – Three charts: an API, a GitHub, and your first original.*

Clearly label your portfolio page so that we can see Week 2. Now add three charts:

1. A chart of IMF lending outstanding, hosted on your GitHub account. The data can be found [here](#) and [here](#)
2. A chart correcting the one used by the [FT](#). The data for this will also be hosted on your GitHub account.
3. A chart which has data delivered by an API. We will discuss this in class.
